Acrylic Compatibility

for Select Refractors, Reflectors and Sockets

Chemicals may be in use at end-user facilities that adversely affect acrylic materials used in light fixtures. These contaminants, when in an airborne state, can impact the safety and integrity of fixture components. Fixture damage may occur as cracking, permeation, crazing and general mechanical failure, and should be immediately replaced with luminaires more suitable to the application.

Exceline has developed a table of the most common chemicals used in commercial and industrial applications. While this list is not all-inclusive, Exceline products with acrylic components should not be used in areas where NON COMPLIANT chemicals may become airborne vapors or mists. Exposure to these compounds identified as NON COMPLIANT will void all warranties associated with the product. Always be sure that chemical interactions are taken into consideration when selecting lighting fixtures, and contact an authorized factory representative for more information.
